RegimeLive newsWhat to watchKey conceptsTrade rules

Current regime

Bear trend — what it means

SPY is trading below its 50-day and 100-day moving averages. The market's overall direction is down. This is when your model is designed to trade — momentum signals are cleaner because the stocks holding up are genuinely strong relative to the rest.

What to expect

Stocks will feel heavy

In a bear trend, even strong setups can get dragged down by the broader market. Your stops exist for this reason. A stock might look great on signals but gap down with the market. Trust the stop, not your gut.

Risk management

Bear markets amplify volatility

ATR tends to expand in downtrends. Your stops are further from entry, position sizes get smaller, and capital at risk stays controlled. The model handles this automatically.

Edge source

Why momentum works in bear markets

In a falling market, stocks with the highest 1W and 3W momentum are the ones institutions are actively buying or defending. That's a real signal — buying pressure behind these names even as everything else sells off.
